

IN THE CLAIMS

Please amend Claims 45, 48, and 51 to read as follows (a complete listing of all the claims appears below):

Claims 1 - 44 (canceled)

~~Claim 45 (currently amended): An information processing apparatus~~

comprising:

a determiner adapted for determining to send an inquiry about information to a network in order to determine a presence or an absence of a printer connected to a the network by sending an inquiry about information to the network;

an inquirer adapted for making an inquiry about a printer language supported by the printer connected to the network if said determiner determines the presence of the printer connected to the network; and

a receiver adapted for receiving information about the printer language supported by the printer, wherein the information about the printer language is sent in response to the inquiry.

Claim 46 (previously amended): The apparatus according to claim 45, wherein said determiner determines a presence or an absence of a new printer connected to the network by inquiring about management information base information to the network.

Claim 47 (canceled)

Claim 48 (currently amended): An information processing method comprising

the steps of:

EP  
OK →  
determining sending an inquiry about information to a network in order to  
determine a presence or an absence of a printer connected to a the network by sending an inquiry  
about information to the network;

E2  
making an inquiry about a printer language supported by the printer to the  
printer connected to the network if said determining step determines the presence of the printer  
connected to the network; and

receiving information about the printer language supported by the printer,  
wherein the information about the printer language is sent in response to the inquiry.

23.  
Claim 49 (previously amended): The method according to claim 48, wherein  
said determining step determines a presence or an absence of a new printer connected to the  
network by inquiring about management information base information to the network.

Claim 50 (canceled)

E3  
OK →  
Claim 51 (currently amended): A computer-readable storage medium for  
storing a program for implementing an information processing method, the program comprising:  
code for determining sending an inquiry about information to a network in

53  
43  
~~order to determine a presence or an absence of a printer connected to a the network by sending an inquiry about information to the network;~~

code for making an inquiry about a printer language supported by the printer to the printer connected to the network if said code for determining determines the presence of the printer connected to the network; and

code for receiving information about the printer language supported by the printer, wherein the information about the printer language is sent in response to the inquiry.

Claim 52 (previously amended): The medium according to claim 51, wherein said code for determining determines a presence or an absence of a new printer connected to the network by inquiring about management information base information to the network.

NS  
Claim 53 (previously added): The medium according to claim 51, wherein the program further comprises code for displaying on a display a message indicating that the printer language supported by the printer is unidentifiable if said code for receiving does not receive the information about the printer language supported by the printer.

Claim 54 (previously added): The apparatus according to claim 45, wherein said determiner determines the presence or the absence of the printer connected to the network periodically.

Claim 55 (previously added): The apparatus according to claim 45, wherein

said determiner determines the presence or the absence of the printer connected to the network in response to a user's instruction.

Claim 56 (previously added): The apparatus according to claim 45, wherein the printer language is used to represent a print job.

Claim 57 (previously added): The apparatus according to claim 45, wherein print data is converted according to the printer language supported by the printer, so that the printer can interpret the print data.

MS.  
Claim 58 (previously added): The method according to claim 48, wherein said determining step determines the presence or the absence of the printer connected to the network periodically.

Claim 59 (previously added): The method according to claim 48, wherein said determining step determines the presence or the absence of the printer connected to the network in response to a user's instruction.

Claim 60 (previously added): The method according to claim 48, wherein the printer language is used to represent a print job.

Claim 61 (previously added): The method according to claim 48, wherein print

data is converted according to the printer language supported by the printer, so that the printer can interpret the print data.

Claim 62 (previously added): The medium according to claim 51, wherein said code for determining determines the presence or the absence of the printer connected to the network periodically.

ms.  
Claim 63 (previously added): The medium according to claim 51, wherein code for determining determines the presence or the absence of the printer connected to the network in response to a user's instruction.

Claim 64 (previously added): The medium according to claim 51, wherein the printer language is used to represent a print job.

Claim 65 (previously added): The medium according to claim 51, wherein print data is converted according to the printer language supported by the printer, so that the printer can interpret the print data.
